

Logistic Regression

1 Classification

Classification

- Email: Spam / Not Spam?
- Online Transactions: Fraudulent (Yes / No)?
- Tumor: Malignant / Benign?

- $y \in \{0, 1\}$
 - 0: "Negative Class" (e.g., benign tumor)
 - 1: "Positive Class" (e.g., malignant tumor)
- $y \in \{0, 1, 2, 3\}$

→ Threshold classifier output $h_{\theta}(x)$ at 0.5:

→ If $h_{\theta}(x) \geq 0.5$, predict "y = 1"

If $h_{\theta}(x) < 0.5$, predict "y = 0"

Classification: $y = 0$ or 1

$h_{\theta}(x)$ can be > 1 or < 0

Logistic Regression: $0 \leq h_{\theta}(x) \leq 1$

↳ Classification

2 Hypothesis representation

Interpretation of Hypothesis Output

$h_{\theta}(x)$ = estimated probability that $y = 1$ on input x

Example: If $x = \begin{bmatrix} x_0 \\ x_1 \end{bmatrix} = \begin{bmatrix} 1 \\ \text{tumorSize} \end{bmatrix}$

$h_{\theta}(x) = 0.7$ $y = 1$

Tell patient that 70% chance of tumor being malignant

$h_{\theta}(x) = P(y=1|x;\theta)$
 $y = 0 \text{ or } 1$

"probability that $y = 1$, given x , parameterized by θ "

$\rightarrow P(y=0|x;\theta) + P(y=1|x;\theta) = 1$
 $P(y=0|x;\theta) = 1 - P(y=1|x;\theta)$

Andrew Ng

3 Decision boundary

Logistic regression

$\rightarrow h_{\theta}(x) = g(\theta^T x) = P(y=1|x;\theta)$

$\rightarrow g(z) = \frac{1}{1 + e^{-z}}$

Suppose predict " $y = 1$ " if $h_{\theta}(x) \geq 0.5$

$\rightarrow \theta^T x \geq 0$

predict " $y = 0$ " if $h_{\theta}(x) < 0.5$

$h_{\theta}(x) = g(\theta^T x)$

$\rightarrow \theta^T x < 0$

$g(z) < 0.5$

$g(z) \geq 0.5$
 when $z \geq 0$

$h_{\theta}(x) = g(\theta^T x) \geq 0.5$

whenever $\theta^T x \geq 0$

\uparrow
 z

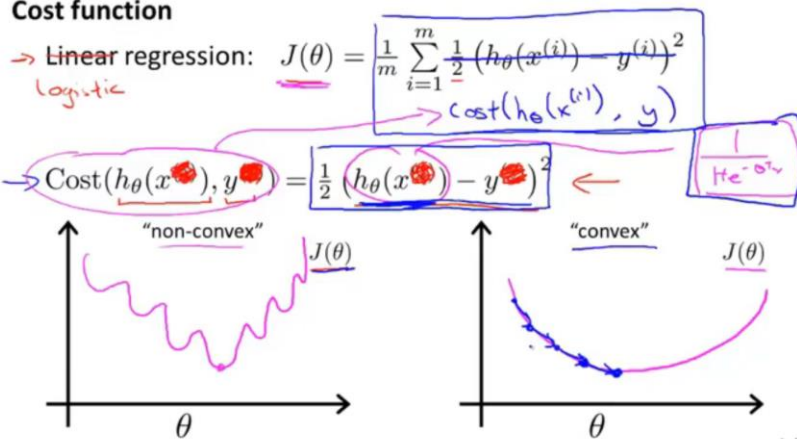

Non-linear decision boundaries

Andrew Ng

4 Cost function

Cost function

Andrew Ng

Logistic regression cost function

5 Simplified cost function and gradient descent

Logistic regression cost function

$$\rightarrow J(\theta) = \frac{1}{m} \sum_{i=1}^m \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)})$$

$$\rightarrow \text{Cost}(h_{\theta}(x), y) = \begin{cases} -\log(h_{\theta}(x)) & \text{if } y = 1 \\ -\log(1 - h_{\theta}(x)) & \text{if } y = 0 \end{cases}$$

Note: $y = 0$ or 1 always

$$\rightarrow \text{Cost}(h_{\theta}(x), y) = -y \log(h_{\theta}(x)) - (1-y) \log(1 - h_{\theta}(x))$$

If $y=1$: $\text{Cost}(h_{\theta}(x), y) = -\log h_{\theta}(x)$

If $y=0$: $\text{Cost}(h_{\theta}(x), y) = -\log(1 - h_{\theta}(x))$

Logistic regression cost function

$$J(\theta) = \frac{1}{m} \sum_{i=1}^m \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)})$$

$$= -\frac{1}{m} \left[\sum_{i=1}^m y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log(1 - h_{\theta}(x^{(i)})) \right]$$

To fit parameters θ :

$$\min_{\theta} J(\theta) \quad \text{Get } \theta$$

To make a prediction given new x :

$$\text{Output } h_{\theta}(x) = \frac{1}{1 + e^{-\theta^T x}}$$

$$p(y=1 | x; \theta)$$

Gradient Descent

$$J(\theta) = -\frac{1}{m} \left[\sum_{i=1}^m y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)})) \right]$$

Want $\min_{\theta} J(\theta)$:

Repeat {

$$\rightarrow \theta_j := \theta_j - \alpha \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)}) x_j^{(i)}$$

(simultaneously update all θ_j)

$$\Theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \vdots \\ \theta_n \end{bmatrix} \leftarrow \text{for } i = 0 \text{ to } n$$

$$h_{\theta}(x) = \Theta^T x$$

$$h_{\theta}(x) = \frac{1}{1 + e^{-\Theta^T x}}$$

Algorithm looks identical to linear regression!

Andrew Ng

6 Advanced optimization

Optimization algorithm

Cost function $J(\theta)$. Want $\min_{\theta} J(\theta)$.

Given θ , we have code that can compute

$$\rightarrow -J(\theta)$$

$$\rightarrow -\frac{\partial}{\partial \theta_j} J(\theta) \quad (\text{for } j = 0, 1, \dots, n)$$

Gradient descent:

Repeat {

$$\rightarrow \theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$$

Optimization algorithm

Given θ , we have code that can compute

$$\begin{bmatrix} -J(\theta) \\ -\frac{\partial}{\partial \theta_j} J(\theta) \end{bmatrix} \quad (\text{for } j = 0, 1, \dots, n)$$

Optimization algorithms:

- Gradient descent
- Conjugate gradient
- BFGS
- L-BFGS

Advantages:

- No need to manually pick α
- Often faster than gradient descent.

Disadvantages:

- More complex

Example: $\min_{\theta} J(\theta)$
 $\rightarrow \theta = \begin{bmatrix} \theta_1 \\ \theta_2 \end{bmatrix}$ $\theta_1=5, \theta_2=5$
 $\rightarrow J(\theta) = (\theta_1 - 5)^2 + (\theta_2 - 5)^2$
 $\rightarrow \frac{\partial}{\partial \theta_1} J(\theta) = 2(\theta_1 - 5)$
 $\rightarrow \frac{\partial}{\partial \theta_2} J(\theta) = 2(\theta_2 - 5)$

```
function [jVal, gradient]
    = costFunction(theta)
    jVal = (theta(1)-5)^2 + ...
           (theta(2)-5)^2;
    gradient = zeros(2,1);
    gradient(1) = 2*(theta(1)-5);
    gradient(2) = 2*(theta(2)-5);

options = optimset('GradObj', 'on', 'MaxIter', '100');
initialTheta = zeros(2,1);
[optTheta, functionVal, exitFlag] ...
    = fminunc(@costFunction, initialTheta, options);
```

$\theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \vdots \\ \theta_n \end{bmatrix}$ $\begin{matrix} \leftarrow \theta(1) \\ \leftarrow \theta(2) \\ \vdots \\ \leftarrow \theta(n+1) \end{matrix}$

```
function [jVal, gradient] = costFunction(theta)

jVal = [code to compute  $J(\theta)$ ];
gradient(1) = [code to compute  $\frac{\partial}{\partial \theta_0} J(\theta)$ ];
gradient(2) = [code to compute  $\frac{\partial}{\partial \theta_1} J(\theta)$ ];
...
gradient(n+1) = [code to compute  $\frac{\partial}{\partial \theta_n} J(\theta)$ ] 1;
```

7 Multi-class classification: One-vs-all

Multiclass classification

Email foldering/tagging: Work, Friends, Family, Hobby

$y=1$ $y=2$ $y=3$ $y=4$

Medical diagrams: Not ill, Cold, Flu

$y=1$ 2 3

Weather: Sunny, Cloudy, Rain, Snow

$y=1$ 2 3 4 \leftarrow

Binary classification:

Multi-class classification:

One-vs-all (one-vs-rest):

Class 1: 
 Class 2: 
 Class 3: 

$$h_{\theta}^{(i)}(x) = P(y = i | x; \theta) \quad (i = 1, 2, 3)$$

Andrew Ng

One-vs-all

Train a logistic regression classifier $h_{\theta}^{(i)}(x)$ for each class i to predict the probability that $y = i$.

On a new input x , to make a prediction, pick the class i that maximizes

$$\max_i h_{\theta}^{(i)}(x)$$
